The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0; Gaps

The present sequence is a protein encoded by one such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       probe. The probes may be used for predicting, measuring and displaying quene expression in samples derived from the human heart via microarrays, by measuring yene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hyperlension, cardiac arrhylmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protein #4004 encoded by probe for measuring heart cell gene expression.
measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPPO at ftp.wipo.int/pub/published_pet_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Single exon nucleic acid probes for analyzing gene expression in human

The present invention provides a number of single exam murleis acid probes which are derived from genomic sequences expressed in the human train. They can be used to measure gene expression in brain cell samples, which may enable diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
                                                                                                           Human brain expressed single exon picke encoded profein SEQ 1D NO: 29537.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sdeo

nucleic acid probes for measuring gene expression in a sample derived from human breast and HT 474 cells. The method involves contacting the probes with a collection of detectably labelled nowless contacting derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA producted to encode proteins. They are useful for gene discovery, and for expression analysis is useful for assessing the toxicity of chemical agents on earlist the microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    measuring human gene expression in a sample derived from human footal
liver. The single exon nucleic acid probes may be used for predicting,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_prt_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, foetal liver, gene expression, single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   than expressed sequence tag microallays. The method is suitable for rapid production of functional information from genemic sequence. Il
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present sequence is a peptide encoded by a single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     probe of the invention.

                                                                                                                                                                                                                                                                                                                                                                The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
          Peptide #8214 encoded by probe for measuring placental gene expression

The invention relates to human polynucleotides (AA17941-AA193841) and the encoded proteins (AA0000019-AA014910) that exhibit activity elating to cytokine, cell proliteration or cell differentiation or which may induce
                                                                                                                                                                                                                                                                                                                                                   Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pvt_sequences.
                                                                                                                                                                                    production of other evickines in other cell populations. The production of other evickines in other cell populations. The polyguclectides and polypeptides have useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytickine like activities, e.g. stem coil growth factor activity, hacmatopolesis regulating
                                                                                                                                                                                                                                                                    activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a number of single exon nucleic acid probose which are derived from grounds expenses expressed in the human brain. They can be used to measure eane expression in brain cell samples, which may enable the ciaquosis and improved treatment of nervous system diseases and as Alzheimer's disease, multiple sclerosis, schizophrenia, epilogsy and cancers, the present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                   filman brain expressed single exon probe encoded protein SEQ ID NO: 33384.
          tetal liver. The present sequence is a poptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ttp.wipo.int/pub/published_pet_sequences.
measuring and displaying gene expression in samples derived from human

They can be used to measure gene expression in hone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, lenkaemia and myeloma. The present sequence is a protein enough by one of the probes of the invention.

                                                                                                                                                                                                                                                                                                                                                     detection of a microbe, using the gyrase gene as the index. The method involves the use of PCR primers to amplify DNA from the microbe, which is then identified or detected depending on its base sequence. The method can be used to classify and identified anionobe strain rapidly and with high precision. The present sequence represents a gyrase protein.
                                                                                                                                                                                 Identification and detection of a microbe - by detection of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention is directed to BAP2B polypeptides, HAP2B polynucleotide Sudurences and regulatory region located at the 3' and 5' ends of the BAP2B coding reason. The BAP2B polypeptides can be expressed by standard recombinant methodology. BAP2B polypeptides and polypeptides have been found to be over expressed in prostate tumour cells, therefore levels of HAP2B expression and/or activity may be assayed (e.g. by polymerase chain reaction (PCR) to diagnose patient suffering from or susceptible to prostate cancer. Antioodics specific for the BAP2B polypeptides are useful as diagnostic reagents. Bialialic markers of the BAP2B ene are useful in genetic analysis. The present sequence represents a protein encoded by a first CDNA sequence of the BAP2B gene consisting of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1917 - tMI: HITTIIII | HITTIIII | HITTIIII | HITTIIII | HITTIIII | HITTIIII | HITTIII | HITTIIII | HITTIIIII | HITTIIII |

The present invention describes primer sets its synthesising 5602 till-length cubas defined in the specification. Where a primer set completentiess, dals an oligo-dl primer and an oligonociocitde complementary to the completentiates and an oligonociocitde complementary strain of a polynociocitde comprises one of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strain of a sequence complementary to the complementary strain of a polynucleotide which comprises a 3'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence of the 5'-end sequence/3'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in the first set in the primer sets, can be used in anisense therapy and if gene therapy. The primers are also useful for the primers of the full-length connex. The primers are also useful for the full-length connex. The primers are also useful for the full-length connex. The primers are also useful for the full-length without any specialization of the full-length connex. The primers are also useful for the full-length connex. The primers are also useful for the full-length connex. The primers are also useful for the full-length connex. The primers and and/or diagnosis of the abnormaling of the full-length connex and a con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent diigonuclectides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                       full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score discribution.
